In qualitative analysis, the solution must be added very slowly. If it is added too quickly and the precipitate is soluble in excess, then you run the risk of missing the formation of the initial precipitate, which dissolves as quickly as it forms in excess solution. The silver halide precipitates

Process of identifying unknown compounds. Compounds may be: Inorganic; organic; Inorganic analysis. This involve mainly identification of ionic compounds containing cations and anions.. Cations present in an ionic compounds are identified by adding a precipitating reagent that forms a precipitate unique to the cation/s in the compound.. The main precipitating reagents used are:

[DOC] Chemistry Practical Qualitative Analysis Sheet

Qualitative analysis is used to identify and separate cations and anions in a sample substance. Unlike quantitative analysis, which seeks to determine the quantity or amount of sample, qualitative analysis is a descriptive form of analysis. In an educational setting, the concentrations of the ions to be identified are approximately 0.01 M in an aqueous solution.

Qualitative Analysis: Identifying Anions and Cations

In qualitative analysis, the given compound is analyzed for the radicals, i.e., cation and the anion, that it contains. Physical procedures like noting the colour, smell or taste of the substance have very limited scope because of the corrosive, poisonous nature of the chemical compounds. Therefore, what one has to resort to is the chemical analysis of the substance that has to be carried out along with the physical examination of the compound under consideration.

Chemistry Qualitative Analysis - Chemistry Practical Class ...

Quantitative reactions are reactions that continue until one of the reactants is finished. Reactions with a strong acid or strong base are quantitative, as are most of the reactions in redox titrations. If the reaction proceeds in only one direction (and is not reversible), it is a quantitative reaction.
