It introduces various methods including FEM (finite element method) to solve PDEs (partial differential equations), i.e. a class of differential equations involving more than one independent variable with some boundary conditions. It also introduces the usage of PDEtool which is the MATLAB built-in GUI (graphic user interface) for solving PDEs.

Let us discuss these types of PDEs here. First-Order Partial Differential Equation. In Maths, when we speak about the first-order partial differential equation, then the equation has only the first derivative of the unknown function having 'm' variables. It is expressed in the form of;  $F(x_1, \dots, x_m, u, u_{x_1}, \dots, u_{x_m}) = 0$ . Linear Partial Differential Equation

In mathematics, a partial differential equation (PDE) is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how  $x$  is thought of as an unknown number, to be solved

In this article, we establish some relationships between several types of partial differential equations and ordinary differential equations. One application of these relationships is that we can get the exact values of the blowup time and the blowup rate of the solution to a partial differential equation by solving an ordinary differential equation.

Later chapters examine Sturm-Liouville problems, Fourier series, integrals, linear partial differential equations (PDEs), and regular perturbation. The author also focuses on examples of PDE applications as they relate to the various conservation laws practiced in chemical engineering.
