The characteristics of a microwave amplifier are gain, stability, noise, power, linearity, etc. We will deal with only the first three properties and give only a measure of the latter two. The choice of the active element will be given by the central frequency f_0 , the passband f , the gain G and the noise factor F .

RF Designers often require several parameter details when placing several amplifiers in a chain. This Qorvo Cascade Calculator provides performance values for system level gain, noise figure (NF) and P1dB for up to 3 cascaded power amplifiers in a chain. NF is the measure of an amplifier's contribution to the overall noise in the system.

Microwave energy is used in both radar and communications applications. The fact that the frequencies are very high and the wavelengths very short presents special problems in circuit design. Components that were previously satisfactory for signal generation and amplification use are no longer useful in the microwave region.
