Network synthesis is a design technique for linear electrical circuits. Synthesis starts from a prescribed impedance function of frequency or frequency response and then determines the possible networks that will produce the required response. The technique is to be compared to network analysis in which the response of a given circuit is calculated. Network synthesis was a great leap forward in circuit design. Prior to network synthesis, only network analysis was available, but this requires tha

In network analysis in the time domain voltage-current relationship are given in terms of differential equations. While in synthesis the complex frequency domain are in algebraic equations. The algebraic equation is the more easily solved than differential equation. In network analysis characteristic signals may be time variant or time invariant.
