Insulin glargine, a new insulin analogue developed using recombinant DNA technology, has a flat pharmacodynamic profile and a 24-h duration of action. Results from a recent comparative study indicate that insulin glargine plus oral therapy may provide better post-dinner glucose control as well as less symptomatic and nocturnal hypoglycemia than oral therapy combined with NPH insulin.

Combination therapy with insulin and oral agents ...

Combination therapy using insulin plus metformin (Glucophage), a sulfonylurea, or both produces glycemic control comparable with using insulin alone, but there is less weight gain when metformin is used (strength of recommendation [SOR]: B, based on systematic review of randomized controlled trials [RCTs] with some heterogeneity).
