Re Quantitative Modelling I Dsc1520 Re Quantitative
DSC1520/SG001 The linear total cost function $TC = FC + V C$ can be graphed by using either the slope and the vertical intercept (or another point on the line), or any two points on the line (e.g. the coordinates on the axes). Consider, for example, the total cost function $TC = 20 + 4 q$, with $FC = 20$ and $V C = 4 q$.

DSC1520/201 7 To determine the slope of the given line $2x = 3y - 5$, we first need to change the given function to the general format of a line, namely $y = mx + c$. We need to change the equation so that y is the subject of the equation. This means we write it on its own on one side of the equation. We start with $2x = 3y - 5$ as given.
