Introduction to Semiconductor Physics and Devices - YouTube

A semiconductor material has an electrical conductivity value falling between that of a conductor, such as metallic copper, and an insulator, such as glass. Its resistivity falls as its temperature rises; metals are the opposite. Its conducting properties may be altered in useful ways by introducing impurities ("doping") into the crystal structure. When two differently-doped regions exist in the ...

Semiconductor - Wikipedia

The basic function of such a device is to switch ON and OFF the flow of electricity as and when required. A semiconductor device can perform the function of a vacuum tube with hundreds of times its volume. A single integrated circuit (IC), such as a microprocessor chip, can do the work of a set of vacuum tubes.

Chapter 3 D. A. Neamen Problem Solutions Chapter 3 3.1 If α_0 were to

increase, the bandgap energy would decrease and the material would

begin to behave less like a semiconductor and more like a metal. If α_0

were to decrease, the bandgap energy would increase and the material

would begin to behave more like an insulator. 3.2 wave equation is: $\nabla^2 \psi + k^2 \psi = 0$
