Stable isotope techniques have provided powerful new information on the diet of mites over time in the field. The relative positions of mite gut contents and tissues in the amount of  $^{13}\text{C}$  and  $^{15}\text{N}$  stable isotope signatures has enabled the assignment of Oribatid Mites into feeding guilds (Schneider et al., 2004; Pollierer et al., 2009). Unfortunately, this requires a minimum mass of mites to enable the analyses to be performed.

Stable isotope probing techniques (SIP) introduce a stable isotope-labeled substrate into a microbial community, follow the fate of the substrate by extracting signal molecules such as phospholipid fatty acids and nucleic acids, and determine which specific molecules have incorporated the isotope (Kreuzer-Martin, 2007). These techniques allow for the study of substrate assimilation in ...

The basic principle of all stable isotope techniques in gastroenterology is to administrate a stable isotope-labeled compound to the body (ie, orally, rectally, or intravenously) in trace amounts to minimally disturb normal physiology, and to subsequently track the fate of the compound or its catabolic products in breath, tissue, feces, urine, and/or blood (7).

The isotope ratio mass spectrometry (IRMS) and deuterium nuclear magnetic resonance ( $^2\text{H-NMR}$ ) techniques are mainly used for the measurement of the stable isotope content.  $^2\text{H-NMR}$  is demonstrated to be very useful for site-specific characterization of organic molecules especially for the intramolecular distribution of deuterium.

In our opinion, the principal strength of stable isotope analysis is the ability to investigate the responses of individuals to environmental conditions (such as habitat and food availability, competition, predation, and predation risk), and ultimately to explore how the responses of individuals influence fitness components (i.e., reproductive success and survival), emerging population dynamics, and community and ecosystem processes (Flaherty and Ben-David 2010). Exploring such complex ...

STABLE ISOTOPE ANALYSIS TECHNIQUES. Analysis: Carbon-13 & Nitrogen-15 of bulk materials Technique: EA-IRMS (Elemental Analysis - Isotope Ratio Mass Spectrometry) For determination of carbon-13 and nitrogen-15 the bulk material must first be converted to pure N<sub>2</sub> and CO<sub>2</sub> to permit analysis by IRMS. In this technique, samples are placed in clean tin capsules and loaded into an automatic sampler.

Isotopic labeling is a technique used to track the passage of an isotope through a reaction, metabolic pathway, or cell. The reactant is 'labeled' by replacing specific atoms by their isotope. The reactant is then allowed to undergo the reaction. The position of the isotopes in the products is measured to determine the sequence the isotopic atom followed in the reaction or the cell's metabolic pathway. The nuclides used in isotopic labeling may be stable nuclides or radionuclides. In the latter
