If we restrict the use of Homo sapiens in the fossil record to specimens which share a significant number of derived features in the skeleton with extant H. sapiens, the origin of our species would be placed in the African late middle Pleistocene, based on fossils such as Omo Kibish 1, Herto 1 and 2, and the Levantine material from Skhul and Qafzeh.

The 2019-nCoV has infected several hundred humans and has caused many fatal cases. Determining the origin and evolution of 2019-nCoV is important for the surveillance, drug discovery, and prevention of the epidemic. With more and more reported pathogenic 2019-nCoV isolates, it is necessary to reexamine their origin and diversification patterns.

The origin and evolution of man, Homo sapiens, have been a topic of great biological interest since time immemorial. The idea that man is a creation of a supernatural power prevailed for long time in earlier days. But the Biologists view the origin of man using knowledge on morphology, physiology, embryology and fossil records.

Understanding the origin and evolution of plant metabolites is fundamental to explaining the distribution of natural products among plant families. These metabolites are produced by plants as a response to abiotic and biotic stress, and also mediate inter- and intra-species communication. They are widely used by humans in medicine and agriculture.

The scientific theory of evolution by natural selection was conceived independently by Charles Darwin and Alfred Russel Wallace in the mid-19th century and was set out in detail in Darwin's book *On the Origin of Species*. Evolution by natural selection was first demonstrated by the observation that more offspring are often produced than can ...

Human evolution, the process by which human beings developed on Earth from now-extinct primates. Viewed zoologically, we humans are Homo sapiens , a culture-bearing upright-walking species that lives on the ground and very likely first evolved in Africa about 315,000 years ago.

Human evolution is the evolutionary process that led to the emergence of anatomically modern humans, beginning with the evolutionary history of primates—in particular genus Homo—and leading to the emergence of Homo sapiens as a distinct species of the hominid family, which includes the great apes.

Presently, heterochrony is considered as a process affecting the origin and evolution of larval forms. Discussions of heterochrony rarely distinguish patterns from processes, and heterochronic patterns are defined as paedomorphosis, truncation of development of a trait relative to development of the trait in an ancestor; or peramorphosis, extension of development relative to an ancestor.

The origin of mammals is now one of the best-documented evolutionary transitions in the fossil record. A leading investigator on this subject, Kemp reviews the numerous changes in features of the skull and postcranial skeleton during this major transition and interprets these changes in functional terms.

Origin and evolution. With the rise of scientific inquiry in the Renaissance, investigators attempted to fit theories on the origin of the Moon to the available information, and the question of the Moon's formation became a part of the attempt to explain the observed properties of the solar system (see Solar system: Origin of the solar system).At first the approach was largely founded on a ...
